Intro.

In this document I will look at the fundamentals of life itself. we will start with the deepest geometry of the atom and ultimately land with the binary philosophy of Leibniz. Just as I did in my previous documents, I will use the **Royal Cubit** and the duodecimal **Base-12** system as our primary rulers. By applying these specific metrics to the raw data of modern science, we strip away the decimal noise and expose the hidden, underlying patterns of matter.

In this work, we do not look at isolated scientific disciplines or abstract software overhead. Instead, we look at a universal, scale-invariant continuum where the microscopic **form** of an atom directly dictates the macroscopic **flow and function** of energy, whether it travels through a computer architecture, a chemical battery, the living soil, or the human brain.

Atom radius in RC.

Why I even look at this is because of one simple question. If a length in antenna technology works on specific lengths and those lengths coincide with the $\pi/6$ the what about the radius of an atom?

If macro-antennas require precise geometric cuts to eliminate standing wave friction and optimize signal flow, a subatomic element must follow the exact same structural laws. An atom is not a static particle; it is a spinning, three-dimensional electromagnetic wave field. Therefore, the empirical **atomic radius** (the physical size of its electron cloud) is nothing less than the exact length at which this microscopic antenna is cut by nature. In short, I would say as above so below.

If you would make a really good antenna, one would make it with specific fractions in mind but the same would work the other way around. A really bad antenna can be made with the opposite fractions. A really bad antenna can be made with the opposite fractions. In radio and antenna engineering, this absolute anti-working measure is known as a **half-wave multi-frequency trap** or a **high-impedance blackout length**.

If you ask an RF engineer to design a multi-band wire antenna, they will provide a strict list of exact physical lengths that must be avoided at all costs. If you cut the wire to these precise bad fractions, specifically a **half-wavelength ($\lambda/2$) or any clean integer multiple of it**, the antenna becomes practically dead. At these specific dimensions, the electrical impedance at the feed point spikes to extreme heights.

I hope this text explains why I want to look at the atom radius with the royal cubit in mind, at the moment we measure in picometers (pm) which is in metric. 0,000000000001 (or 10^{-12}) meter. As far as I know the fractions of measurement in atoms is not yet measured as radiotechnology does let alone the link with the royal cubit. It is kind of logical though because $\pi/6$ makes more sense to a researcher than mentioning some historical measurement.

Now I will map out all 118 elements and their atomical radius in picometer. After that I will look at the value in royal cubit and lastly the value in duodecimal. Note that some elements are not mapped on their atom radius and thus not present. This is for multiple reasons and one of those reasons is the lifespan of radioactive elements which is why francium per example is an estimation.

For context 1RC is calculated as 523.59877.. mm.

It should be noted that the radius shifts in relation to other atoms. Because empirical data is always a snapshot, this mapping represents a snapshot of an ideal state. In previous drafts, I mistakenly used the 'metallic radius' for this table. This was a bit shitty, because when you search online, most sources blurt out mixed definitions from multiple measuring methods, such as the Empirical atomic radius, Covalent radius, or Van der Waals radius. Mixing these four distinct methods caused major inconsistencies in the matrix. Therefore, I specifically chose the '**Isolated atomic radius**', better known as **the calculated atomic radius**, because I wanted to evaluate the element in its absolute **ground state**. I used the site "<https://ptable.com>" and I also set the temperature on 0 Kelvin, see the screenshot attached. Since the website only showed native language, I have included the weblink as well.

(Note: Elements **Rf** through **Og** are omitted from the calculated dataset due to their extreme instability and *means estimation with **Fr** and **Ra** due to same reasons.).

With RC fractions working on 144MHz this should be made with that in mind since not every length works well with every kind of MHz's. Science has measured the MHz of different elements but the difference is that normally we use spectroscopy to measure it. The difference now could best be shown as a guitar. Where science looks at what sound the instrument makes when played is the other look at the frequency of the sound box itself.

So, spectroscopy works by shining a light through a sample and measuring exactly which wavelengths are absorbed, emitted, or scattered. Because every element and molecule has a unique atomic structure, it interacts with only specific energies of light, creating a distinct chemical fingerprint.

To still think in terms of sound you could say spectroscopy is a bit like listening to music that the instrument makes and the thing I describe is the physical measurements and ground note of the music box. This is off course a bit of an oversimplification but it should give a rough explanation of the topic. There are many things in play that affect atoms. To look at the classical diameter of an electron cloud is quite something different than looking at the spectrographic frequencies that are defined by $\Delta E = h \cdot f$.

To put it in more scientific terms, *the displayed THz values represent a theoretical EM-frequency where the physical atomic radius is modelled as a perfect half-wave antenna, rather than reflecting the active emissions of the element. It should be viewed as a passive resonator, a geometric cavity meaning it does not function as an active transmitter. Atoms are not just antennas and thus is this more a thought experiment rather than a predicting model as so far.*

The use of the zodiac could also best be understood as a traditional mapping. This is not to expect or imply any form of sacredness or magic but rather as an archetypical mapping. It should best be interpreted as an author's choice since there are no proven scientific correlations between atoms and astrology. It could be interesting to look at cultural correlations but that is not relevant now the biggest problem I have with this mapping is that it falls or stands with the accuracy of science. With micro-scaling comes macro-jumps if something is wrong. A meter is nothing if you are a human but for an ant it is quite a walk.

To provide greater oversight, I have structured this data into a grid.

In earlier drafts, my investigation initially focused on dynamic resistance, and it was only through subsequent development that I integrated this section regarding the physical geometry of the atomic radius. In hindsight, the initial metric approach felt incomplete, and upon re-evaluation, returning to this foundational geometric perspective proved essential. While the dynamics of resistance will be examined in greater depth later in this document, it is necessary to introduce the concept here because resistance is standardly measured at a stable 20°C and fluctuates per degree. Fascinatingly, certain elements, such as, **Ru** (Ruthenium) require significant cooling to unlock their optimal conductivity.

I found this quite intriguing, especially in relation to the recently discovered Kagome lattice. This structural phenomenon was uncovered through international quantum physical calculations and with the use **AI** (artificial intelligence). This part is a lean in into the next chapter,,

The Kagome Lattice and geometric pattern recognition.

So, what I did was looking at the geometry and the physical distance not linear but cyclic. The use of $\pi/6$ is in this case of the utmost importance because it is both cyclic and easy to use with duodecimal.

But what even is Kagome? Here is a short overview of the subject; The term "Kagome" comes from the traditional Japanese art of basket weaving, referring to a specific pattern of interlaced bamboo strands. In physics and material science, a Kagome lattice describes an arrangement of atoms that mimics this pattern, forming a network of corner-sharing triangles and hexagons.

This specific geometry has recently become a hot topic in quantum physics. Because of the way the triangles overlap, electrons traveling through a Kagome structure become trapped in what scientist's call "flat bands." Inside these flat bands, electrons slow down and begin to interact strongly with one another, causing unusual quantum behaviours such as the ability to conduct electrical current with zero resistance called **superconductivity**.

Discovering which elements can physically form a stable Kagome lattice is incredibly difficult. Recently, international research consortiums have used artificial intelligence to screen billions of atomic combinations. This process led to the discovery of new Kagome superconductors like **YRu₃B₂** (Yttrium-Ruthenium-Boride) and **LuRu₃B₂** (Lutetium-Ruthenium-Boride).

When looking at a Kagome lattice, standard science uses complex vector mathematics to calculate how atoms arrange themselves into triangles and hexagons. However, a Kagome structure is fundamentally built on geometric angles of 30, 60, and 180 degrees. By converting the linear picometer data using a $\pi/6$ ruler and a Base-12 grid, my mapping translates the physical size of an atom directly into a phase angle on a 360-degree circle. This naturally divides the space into 12 equal sectors of 30 degrees.

When we test this thought experiment against the actual elements discovered by AI for the Kagome superconductors, specifically Lutetium (Lu) and Ruthenium (Ru), the hidden harmony becomes clear. In the tables shown here, Lutetium has a phase angle of 158.21°, while Ruthenium stands at 343.79 degrees. The difference between them is almost exactly 185°, which is remarkably close to a perfect 180° opposition. I have to note that 5° difference is significant but at the same time I do keep in mind

that the table is very accuracy sensitive. From 1° to 360° is a gap of 5.58° still pretty close and even though it is not an exact parallel it seemed noteworthy.

In wave mechanics, a 180-degree phase difference represents exact opposition, acting as a structural balance. This could show that the elements chosen by nature to form the Kagome lattice are not random; their passive resonators are geometrically tuned to balance each other out perfectly within the structure.

Material resistance in RC.

This section expands on the concept mentioned in chapter 1. Here, I have calculated the electrical resistivity of metals, transforming the raw data from metric values into Royal Cubit coordinates. Just as before, I filtered these measurements through the duodecimal Base-12 grid. However, while chapter 1 mapped atomic shapes using a continuous phase angle, this chapter compresses the data by passing it through a modulo-11 calculation.

This mathematical operation reduces the complex resistivity numbers into ten distinct ground roots (Vortex Roots 1 through 10). These roots act as numerical anchors, allowing us to map the electrical behaviour of different elements into specific zodiac archetypes.

Resistance in metals do change with temperature so to start I have to define the degrees first. Because we measure mostly with copper, I have set the degree to 15°C (288 K). This specific number is because of base-12 since firstly it is the international standard of meteorology and aviation and secondly because it is 12 times 24 from the 0 point of where atomic movement ceases. This temperature should be the most harmonious choice from both a scientific and an esoteric perspective.

Regarding unique elements like Quartz, Teflon, Silicon, or Germanium, which either act as absolute blockers or exhibit highly variable resistance. It is most logical to assign them permanently to positions 11 and 12. If I had mapped all general elements continuously across positions 1 to 12, these exceptional materials would break the logic of the mapping.

From an astrological perspective, these positions feel most natural: Aquarius (Position 11) is traditionally ruled by Saturn, which is inherently connected to limitations, walls, and crystallisation. Conversely, Pisces (Position 12) is connected to ultimate transformation and the total dissolution of limitations.

All subsequent calculations are performed using the exact values of pure chemical elements, rather than commercially available alloys.

So, this is roughly where the earlier draft started. But instead of just one resistance table, there are two now.

The next logical thing to do is to put them side by side and look at the differences. The very fact that these differences exist should tell us that this framework is about something deeper than simply saying 'this element belongs to this zodiac sign'. From a pure data perspective, it is much better to look at it as a **'Phase Space Cluster Index'**.

So, let's start with the first question that comes to mind:

What should this tell us?

Science has already measured resistance extensively, so on the surface, there shouldn't be anything new here.

Yes, there shouldn't be anything new here. The only thing I actually did was taking a different measurement, counting in duodecimal and mapping it out in sections of 10 and relegating 2 to the extremes.

So, there are two questions that come to mind.

A: Is this done before?

B: what does it show us?

So as far as I know and as far as I have researched. No, this specific method has not been done before.

And logically so. Science ignores any motion of RC calculations because it is viewed as a historical measurement based on human anatomy. So, the notion $\pi/6$ is ignored. Besides that, is duodecimal counting something either some spiritualists are using or some nerd with a strange obsession. Also is vortex-based mathematics seen as esoteric numerology even though it is basically a way of number compression. So, in three specific ways is this both unorthodox and a blind spot for science. Ironically enough scientific heresy one might say.

The next question is less simple, and here I have to say that I cannot draw any conclusions but I can tell the things I notice.

I do have limited knowledge about metallurgy so take this part strictly as an observation instead of a conclusion.

- **1. The big rush to Aries (Vortex Root 1)**

At room temperature (288 K), the metals are spread out nicely across all kinds of different sections. But when we cool them down to 144 K, a huge group of metals like **Au** (Gold), **Ag** (Silver), and **Al** (Aluminium) suddenly jump into Aries (Vortex Root 1). It is like the extreme cold strips away their differences and forces them back to the exact same starting position of the grid.

- **2. The anchors that refuse to move**

While most metals start traveling through the sections when cooled, a few elements stand perfectly still. Elements like **Pb** (Lead) and **Ru** (Ruthenium) stay exactly in the same position (Aries) in both tables. They act as the unmovable anchors of the whole system.

- **3. Metals forming new families**

In the cold table (144 K), the traveling metals do not land randomly. They start clustering together in very specific groups. For example, **Fe** (Iron), **Ti** (Titanium), and **Cu** (Copper) suddenly sit together in Gemini (Vortex Root 3). It shows that under the influence of base-12 cold; these completely different materials start to behave like a synchronized family.

The Elements as Functional Software (Anchors vs. Travelers)

If we look closely at how all elements behave between the two temperatures, a clear system emerges. We can map them into two distinct functional states:

1. The Hardware Anchors (The Unmovable Fixed Pillars)

Some elements act like the permanent physical pillars of the machine. Elements like **Pb (Lead)** and **Co (Cobalt)** refuse to move when cooled; they stay firmly in Aries (Vortex Root 1) in both tables. Their role is structural stability. No matter how much energy or temperature shifts around them, their base function never changes.

2. The Active Switches (The Thermal Travelers)

Other elements behave like active software code that adapts to changing conditions. When the temperature drops, they shift to a new section to fulfil a different role:

- **The Kings returning to the Source:** Precious conductors like **Au (Gold)** and **Ag (Silver)** drop all their resistance in the cold and rush back to Aries (Root 1) to allow a pure, unhindered spark of energy.
- **The Network Families:** Elements like **Cu (Copper)**, **Fe (Iron)**, and **Ti (Titanium)** start completely separated at room temperature. But under the influence of base-12 cold, they perfectly synchronize and land together in Gemini (Vortex Root 3). They turn from isolated materials into a collective network team.

Conclusion: It seems that the zodiac sections represent **states of functionality**. The temperature acts like a dial. By changing the temperature, we change the geometric sector where a metal operates, turning the elements into a natural, predictable instruction set. This is the best conclusion I can come up with, if we as humans can map these states correctly the rest of this document and later discussed topics can become more probable too.

One thing I can say with utmost certainty is that the mapping does not correlate with efficiency, Leo=superconductor would be false. The best thing I could say is that it more resembles a piece of a puzzle rather than a complete framework.

Sun god Ra through the 12 hours of the underworld.

The reason for including this and the next chapter is merely to show the spark of inspiration behind the mapping, this since sometimes writing down the equation is just as important to the end result.

The Active Light: Hours 1 to 9

1. ♈ Aries – The 1st Hour:
The Gateway of the Beginning Ra arrives at the western horizon and leaves his daytime chariot. He steps into the night barque and sails through the first giant gateway of the underworld. This is the first spark in the darkness: the direction is set, and the journey begins.
2. ♉ Taurus – The 2nd Hour:
The Fertile Plain The boat enters a wide, watery river plain. Here, Ra grants fertility and substance to the spirits of the earth. This hour brings weight, calmness, and a solid foundation to the vessel, ensuring that the storms of the night cannot destroy the ship.
3. ♊ Gemini – The 3rd Hour:
Splitting the Current The river splits into two equal channels. Ra must speak the secret names of the guardians on both sides of the riverbanks. The opposing forces are brought into perfect balance here, allowing the boat to sail straight through the middle without steering off course.
4. ♋ Cancer – The 4th Hour:
The Hidden Shield The river suddenly dries up and turns into a desert of sand. The boat changes its form to glide invisibly and safely across the dry sand, secure from the serpents lurking in the dark. This is the hard, protective shield that keeps the inside safe.
5. ♌ Leo – The 5th Hour:
The Fiery Cavern The boat reaches the deepest, hottest core of the subterranean mountain. Here lies the hidden cavern of the falcon god, surrounded by lakes of boiling fire. Ra braves the intense heat of the central inner sun. This is the point where the shape freezes and holds its form in the heat of the battle.
6. ♍ Virgo – The 6th Hour:
Cleansing the Stream The water returns, and the boat merges with the primeval world-serpent. The crew washes themselves, and all heavy baggage is cast overboard. This is the hour of absolute purity and clarity, creating a completely clean path for the rest of the journey.
7. ♎ Libra – The 7th Hour:
Overcoming the Great Serpent The giant chaos-serpent attempts to swallow the water of the river to stop the sun. Using magical voices and sharp knives, the crew binds and subdues the serpent. The balance of the cosmos is restored, and the danger is averted.

8. ♏ Scorpio – The 8th Hour:

The Sealed Chambers The boat sails through a series of dark, hermetically sealed caves where the ancient gods dwell. The doors open only when Ra calls out their exact pitch. The chambers are tightly shut so that the divine power cannot escape outward.

9. ♐ Sagittarius – The 9th Hour:

The Highest Force The night barque achieves its absolute highest speed and momentum. The crew of the sun god handles their oars with total precision and focus. Every force is maximally charged, bundled, and ready to break through the final boundary.

The Turning Point: The Deep Transformation After the highest force, the familiar world ends. The boat plunges straight down, away from the known river, directly into the hidden dimensions of the cosmos:

10. ♉ Pisces – The 10th Hour:

The Plunge into the Primeval Ocean Instead of a river or land, Ra's boat suddenly plunges into the deep, fluid waters of the primeval ocean. All fixed forms built during the day dissolve completely here. The crew can no longer steer, and regular time stands still. Everything implodes into the absolute state of rest in the depths of the sea.

11. ♑ Capricorn – The 11th Hour:

The Wall of Stone Deep beneath the water, the sun reaches the most dangerous and restrictive point of the night. A giant world-serpent restores order by wrapping itself completely around the boat like an impenetrable, iron sphere. Outside this sphere, chaos is thrown into deep pits of stone to trap it forever. This is the absolute wall of infinity and stillness that guards the structure.

12. ♒ Aquarius – The 12th Hour:

The Emergence of the Spirit The very last hour before the dawn. Ra sails into the back of the world-serpent as an old, dying God. Inside this fluid body, a complete reversal takes place: the old form falls away, and the sun god crawls out of the serpent's mouth as the sacred scarab beetle, the young morning sun. The heavy stones of the underworld shatter, the veil of night is torn apart, and the fluid life-spirit flows over the earth once more.

The Hermetic Tradition.

Just like the 12 hours of Ra, the ancient Hermetic and Alchemical traditions should be viewed as an inspiration for this mapping rather than a rigid scientific proof. Alchemists did not have digital modern equipment, so they used planetary archetypes to describe the functional behaviour of metals.

When we look at the data, this "historical intuition" shows remarkable overlaps. In alchemical lore, **Pb** (Lead) is connected to Saturn the principle of ultimate weight, density, and the unmovable *Prima Materia*. In my mapping, lead acts exactly like this; it is one of the few elements that refuses to move, staying firmly anchored in Aries (Vortex Root 1) at both 288 K and 144 K.

Conversely, **Ag** (Silver) was known as *Luna*, the fluid and flawless highway of light. In the cold matrix, we see Silver drop its resistance and sprint straight to Aries (Vortex Root 1), unlocking its pure conductive potential.

But what is the hermetic tradition historically?

Historically, the **Hermetic tradition** was an ancient Alexandrian system (circa 100–300 CE) that treated the universe as a single, scale-invariant matrix.

Its primary law "*As above, so below*" dictates that microscopic matter and macroscopic cosmic forces follow the exact same geometric rules.

1. The Stages of the Great Work (*Magnum Opus*)

Alchemists mapped the evolution of matter through chronological chemical and thermal phases:

- **Nigredo (Blackness / Deconstruction):** Matter is dissolved, frozen, or stripped of its surface traits to reveal its absolute ground state (*Prima Materia*).
- **Albedo (Whiteness / Purification):** The material is washed, stabilized, and brought into perfect symmetrical balance.
- **Rubedo (Redness / Ignition):** The purified matter is struck by energy (heat/voltage), shifting it into a highly active, unified state of operation.

2. The Elemental Principles

Rather than viewing elements as isolated chemical substances, Hermeticism viewed them as **functional states of energy**:

- **The Three Primes (*Tria Prima*):** **Salt** represents contraction, density, and structural boundaries (the hardware). **Sulphur** represents active, heat-driven transformation (the energy). **Mercury** represents fluid, adaptable connectivity (the software)
- **The Metals:** Each pure metal was assigned a planetary archetype to describe its native behavioural response to energy. For example, **Pb** (Lead) was mapped to Saturn to describe the unmovable, heavy ground-axis, while **Ag** (Silver) was mapped to Luna to describe a flawless, passive mirror for fluid energy.

This is mostly a short version and an exoteric point of view. It should be noted that science has delegated most of hermetism to the esoteric realm. In earlier drafts I tried to see if Hermetism would be a mapping match, it did not so and thus for that reason the note of it as inspiration rather than trying to implement it functionally. Perhaps there was something I missed so this note still stands just in case.

Shao Yong I Ching diagram Leibniz.

From here on out the document is more focussed on computing and the document could be viewed as starting truly from here on out.

Gottfried Wilhelm Leibniz discovered that the Shao Yong I Ching operates on a binary system.

While he analysed it through a Hellenistic mathematical lens, he altered the sequence to make it fit

his model. In this study, I will also approach the system from a Hellenistic perspective, but I will strictly adhere to tradition by following the original Fu Xi sequence.

So, let's have a look at this and look at tradition.

Normally we have 5 elements, earth, water, fire, air and aether. (Terra, Aqua, Ignis, Caelum and Aetheris.) the last one is counted as the element that is not present on earth. For this reason, the seasons are also noted on the earth elements thus excluding the aether. Looking at the Shao Yong I Ching diagram we see that the lesser and greater yin and yang's coincide with this.

We can see a clear break with western tradition where the months are divided with a 12, we see here a total absence of the aether points resulting in 8. The elements in aether are; ♌ Leo, ♑ Capricorn and ♒ Aquarius. In western tradition Leo is the way to heaven at his location

directly below Aquarius, Capricorn and Aquarius together is often seen as the garden of Eden. At a first glance it seems these topics are unrelated, but when you look at the numbers and value's you can see logical overlapping and deliberate decisions.

If you look at Chinese mythology the meaning is completely logical.

They are two sides of the same coin, where the one describes the form, the other describes the function. This also explains why the row above the greater and lesser Yin and Yang's are divided in two equal divisions. Metal is like the aether not found on earth in a symbolical and descriptive way.

Mostly the west looks at eastern tradition literally. Instead of taking them as equal I have divided them as earlier said form and function.

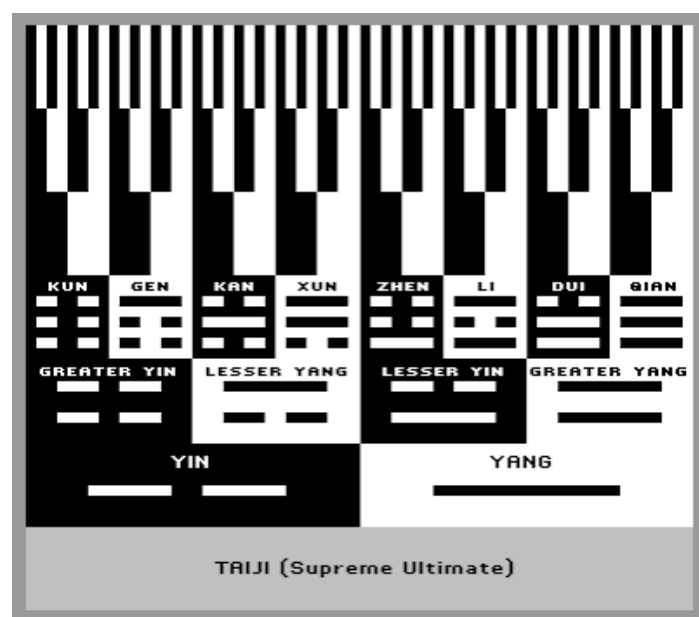

Earth is literally stable and grounded but in Wu Xing water is the basis for life.

Water is literally fluid and changing but in Wu Xing the earth is always moving.

Fire is literally the expanding warmth but in Wu Xing wood grows to the heavens.

Air is literally untouchable creativity but in Wu Xing it's fire that inspires and makes one look up to the skies.

Aether is the realm of the gods and the combination of all elements while in Wu Xing metal is made from all the others and only humans can make metal. The connection to the importance of metal is found in multiple cultures all across the world, but if one is looking at only the words and not their meaning, then that makes it near impossible to see the correlations.

Hellenic	Wu Xing
Earth	Water
Water	Earth
Fire	Wood
Air	Fire
Aether	Metal

In online communities and over the years people have tried to make the connection between east and west but it never seems to work. This is simply because people try to literally overlap these symbols. There are so many people who tried and believed their own faults to a degree that the original meaning is near lost. This small part is partly serving as criticism to the spiritualist's community. Fire is not fire.

Taking a literal interpretation of the two systems, which is quite ironic seeing how spiritualists do the exact thing they blame academia of doing. But credits given where credits are due, at least the position of metal and the aether is almost always correct. It seems that by instinct we know the outlier by default even though the combination or insight is missing.

Wu Xing Ying and Yang.

The sequence is normally according to the seasons. **Greater Yin** (Winter, water), **Lesser Yang** (spring, wood) **Greater Yang** (summer, fire) **Lesser Yin** (autumn, metal).

This seemed for me like A1,B2,A2,B1.

So I made it into, A2,A1,B1,B2.

The reasoning for it was that you could loop it now, from same number to same letter. Coincidentally I found out that this configuration is also East, North, West and south.
(sidenote: 'Prasavya' in Buddhism)

Wu Zheng Se.

In the upcoming chapters the elements are noted with the names. Let's zoom in at the elements according to Chinese tradition. To the right I have coloured in elements according to the original Wu Xing coding and according to western tradition.

Hellenic	Wu Xing
Fire	Wood
Air	Fire
Water	Earth
Aether	Metal
Earth	Water

It should be noted that the west is quite loose with its colour coding while Wu Xing is very strict about it. For simplicity's sake I name it Hellenic since that is the core origin instead of hermetic or astrological since those are separate branches with different colour coding's.

The colour coding of Wu Xing is called Wu Zheng Se (the 5 primary colours) as is this chapter's name.

- | | | |
|--------------------------|----------------------------------|-------------|
| • Wood: Green/Cyan. | Spring, growth, vitality. | The East. |
| • Fire: Red | Summer, passion, transformation. | The South. |
| • Earth: Yellow/Brown | After summer, stability. | The Centre. |
| • Metal: White/Grey | Autumn, structure, purity. | The West. |
| • Water: Black/Dark blue | Winter, depth, wisdom. | The North. |

Wu Xing Trigram's

The names and their meanings.

- **QIAN (乾)** – The Sky / Heaven (☰): This is the ultimate Yang Metal. It represents pure creative power, leadership, focus, authority, and the laws of the universe.
- **DUI (兌)** – The Lake / Marsh (☱): This is Yin Metal. It symbolizes joy, communication, openness, and the autumn harvest. While Qian is hard like a sword, Dui is fluid like a shimmering surface of water.
- **KUN (坤)** – The Earth (☷): This is the ultimate Yin Earth. It represents total surrender, receptivity, nurturing, and the primordial mother. It is the soil that carries and feeds all life.
- **GEN (艮)** – The Mountain (☶): This is Yang Earth. It stands for stillness, meditation, boundaries, and immovable inner strength. While Kun is the soft agricultural soil, Gen is the solid rock.
- **ZHEN (震)** – The Thunder (☳): This is Yang Wood. It represents sudden action, movement, spring energy, and young green sprouts bursting through the earth with sheer force.
- **XUN (巽)** – The Wind / Wood (☴): This is Yin Wood. It symbolizes flexibility, gentleness, adaptability, and tree roots that slowly but surely carve their way through rock. Element: Water (Wisdom & Flow)
- **KAN (坎)** – The Water / The Chasm (☵): This trigram is unique because it directly shares its name with the element of Water. It represents depth, the unknown, intuition, danger, and the absolute drive to survive by flowing around any obstacle.
- **LI (離)** – The Fire / The Radiance (☲): Just like Kan, Li stands on its own and claims the element of Fire. It represents passion, illumination, intellect, vision, and transformation. It provides light but requires fuel (Wood) to sustain itself. so, we see fire and water only one time and all of the others 2 times. (sidenote) KAN (坎) and LI (離) (water and fire) are polar opposites of each other, this works asymmetrical in itself but with connection to the rest they work asymmetrical. It is a specific sequence in the form of 3 times 2 and 2 times one. Like a machine and nature in itself there would be no movement if it was balanced, there should always be chaos in order like the Taoists dictate. (Thermodynamic balance.)

Greater Yang		Lesser Yin	
QIAN (乾) – The Sky / Heaven	Metal 金	ZHEN (震) – The Thunder	Wood 木
DUI (兌) – The Lake / Marsh	Metal 金	XUN (巽) – The Wind / Wood	Wood 木
Greater Yin		Lesser Yang	
KUN (坤) – The Earth	Earth 土	KAN (坎) – The Water / The Chasm	Wood 木
GEN (艮) – The Mountain	Earth 土	LI (離) – The Fire / The Radiance	Fire 火

Wu Xing Tetrargam's.

In a very symbolic and yet quite literal way the division is in material and function order.

The 8 Heavenly Tetragrams (Cosmic Forces) These describe the dynamics of light, stars, heat, and cold (governed by Tai Yang and Shao Yin)		The 8 Earthly Tetragrams (Physical Manifestations) These describe the physical forms and currents manifested on Earth (governed by Shao Yang and Tai Yin)	
Great Heat (Pure Yang)	Fire 火	Great Force of Wind	Wood 木
Lesser Heat	Fire 火	Lesser Force of Wind	Wood 木
Light of the Stars	Fire 火	Flowing River Water	Wood 木
Sunlight	Fire 火	Rainwater	Wood 木
Moonlight	Water 水	Dew water	Metal 金
Light of the Planets	Water 水	Groundwater	Metal 金
Lesser Cold	Water 水	Lesser Immovability of the Mountain	Earth 土
Great Cold (Pure Yin)	Water 水	Great Immovability of the Mountain	Earth 土

Wu Xing Octet's.

Octet 1: The 8 Heavenly Bodies (Derived from Fire: Energy) These represent the macro-structures of the physical universe that hold light and celestial matter.		Octet 3: The 8 Earthly Structures (Derived from Wood: Motion) These represent the dynamic geological features and flowing resources on the Earth's surface.	
The Sun (日) — Absolute central Yang energy.	Fire 火	The Great Rivers (水) — Continuous liquid currents.	Water 水
The Moon (月) — Central reflective Yin mass.	Fire 火	The Fire/Lava (火) — Terrestrial heat and transformation.	Fire 火
The Stars (星) — Points of fixed cosmic light.	Water 水	The Soil/Plains (土) — Receptive land capable of growth.	Earth 土
The Planets/Zodiac (辰) — The structural pathways of time.	Water 水	The Rocky Mass (石) — Hard, unyielding structural matter.	Wood 木
The Celestial Heat (暑) — Radiant active temperature.	Wood 木	The Great Oceans (海) — The vast reservoir of water.	Water 水
The Cosmic Cold (寒) — Absorbent passive vacuum.	Wood 木	The Active Volcanoes (火山) — Piercing earth-bound heat.	Fire 火
The Daylight (晝) — The manifest cycle of illumination.	Earth 土	The Deep Canyons (谷) — Low, hollow voids in the landscape.	Wood 木
The Night (夜) — The hidden cycle of darkness.	Earth 土	The High Plateaus (原) — Elevated, flat land masses.	Earth 土
Octet 2: The 8 Atmospheric Forces (Derived from Water: flow and movement.) These describe how cosmic energy moves through the sky and creates weather dynamics.		Octet 4: The 4 Material Forms (Derived from Earth: Physical Matter/pure form) These describe the non-sentient, physical foundation of the planet. They are completely bound to the soil, anchoring the material world.	
The Great Wind (風) — Sweeping atmospheric motion.	Wood 木	The Flora/Plants (草) — Soft, adaptive organic growth.	Wood 木
The Thunder (雷) — Sudden electrical release.	Wood 木	The Trees/Forests (木) — Rigid, vertical organic structure.	Wood 木
The Rain (雨) — The descent of moisture.	Water 水	The Minerals/Ores (金) — Crystallized subterranean elements.	Earth 土
The Dew (露) — The quiet condensation of air.	Water 水	The Heavy Stones (石塊) — Dislodged geological mass.	Earth 土
The Frost (霜) — The freezing contraction of vapor.	Earth 土	Octet 5: The 4 Material Forms (Derived from Metal: Application of Order / Cosmic Blueprint) These describe the transition into conscious, mobile, and complex life. They possess internal nervous systems, structural frameworks, and the capacity to breathe and process the atmosphere (Qi).	
The Snow (雪) — The crystallization of water.	Earth 土		
The Fog/Mist (霧) — The blurring boundary of air and water.	Fire 火	The Animals (獸) — Mobile, active physical life.	Water 水
The Clear Sky (晴) — The calm, unhindered atmosphere.	Fire 火	The Birds/Fowl (禽) — Atmospheric, light physical life.	Water 水
		The Invertebrates (蟲) — Ground-bound, primitive life.	Fire 火
		The Human Form (人) — The final synthesis of Form and Function.	Fire 火

Wu Xing final layer.

1. Row of Water 水		2. Row of Fire 火	
Kun (坤) – The Receptive / Earth	Earth 土	Fu (復) – Return / The Turning Point	Wood 木
Bo (剝) – Splitting Apart / Peeling Off	Earth 土	Yi (頤) – Providing Nourishment / Jaws	Wood 木
Bi (比) – Holding Together / Union	Water 水	Tun (屯) – Difficulty at the Beginning	Water 水
Guan (觀) – Contemplation / View	Wood 木	Yi (益) – Increase	Wood 木
Yu (豫) – Enthusiasm / Readiness	Wood 木	Zhen (震) – The Arousing / Thunder	Wood 木
Jin (晉) – Progress / Advancing	Fire 火	Shi He (噬嗑) – Biting Through	Fire 火
Cui (萃) – Gathering Together / Massing	Metal 金	Sui (隨) – Following	Metal 金
Pi (否) – Standstill / Stagnation	Metal 金	Wu Wang (無妄) – Innocence / The Unexpected	Metal 金
Qian (謙) – Modesty / Humility	Earth 土	Ming Yi (明夷) – Darkening of the Light	Fire 火
Gen (艮) – Keeping Still / Mountain	Earth 土	Bi (賁) – Grace / Adornment	Fire 火
Jian (蹇) – Obstruction / Water on Mountain	Water 水	Ji Ji (既濟) – After Completion	Water 水
Jian (漸) – Development / Gradual Progress	Wood 木	Jia Ren (家人) – The Family / The Clan	Wood 木
Xiao Guo (小過) – Preponderance of the Small	Wood 木	Feng (豐) – Abundance / Fullness	Fire 火
Lu (旅) – The Wanderer / Travel	Fire 火	Li (離) – The Clinging / Fire	Fire 火
Xian (咸) – Influence / Wooing	Metal 金	Ge (革) – Revolution / Molting	Metal 金
Dun (遯) – Retreat	Metal 金	Tong Ren (同人) – Fellowship with Men	Metal 金
3. Row of Wood 木		4. Row of Metal 金	
Shi (師) – The Army / The Multitude	Water 水	Sheng (升) – Pushing Upward	Wood 木
Meng (蒙) – Youthful Folly / Inexperience	Water 水	Da Xu (大畜) – The Great Taming Power	Earth 土
Kan (坎) – The Abysmal / Water	Water 水	Xu (需) – Waiting / Nourishment	Water 水
Huan (渙) – Dispersion / Dissolution	Wood 木	Da You (大有) – Possession in Great Measure	Fire 火
Jie (解) – Deliverance / Liberation	Wood 木	Da Guo (大過) – Preponderance of the Great	Wood 木
Wei Ji (未濟) – Before Completion	Fire 火	Ding (鼎) – The Caldron	Fire 火
Kun (困) – Oppression / Exhaustion	Metal 金	Gou (姤) – Coming to Meet	Metal 金
Song (訟) – Conflict / Strife	Metal 金	Da Zhuang (大壯) – Power of the Great	Metal 金
Lin (臨) – Approach	Earth 土	Tai (泰) – Peace	Earth 土
Sun (損) – Decrease / Diminishing	Earth 土	Gu (蠱) – Work on what has been Spoiled	Wood 木
Jie (節) – Limitation / Restriction	Water 水	Jing (井) – The Well	Wood 木
Zhong Fu (中孚) – Inner Truth	Wood 木	Xun (巽) – The Gentle / Wind	Wood 木
Gui Mei (歸妹) – The Marrying Maiden	Wood 木	Xiao Chu (小畜) – The Taming Power of the Small	Wood 木
Kui (睽) – Opposition / Estrangement	Fire 火	Lu (履) – Treading / Conduct	Metal 金
Dui (兌) – The Joyous / Lake	Metal 金	Guai (夬) – Break-through / Resoluteness	Metal 金
Lu (履) – Treading / Conduct	Metal 金	Qian (乾) – The Creative / Heaven	Metal 金

The Wu Xing duodecimal system.

Let's be brutally honest at one thing. More's law is dead. The whole idea is to create a **multilayer system**. Instead of making a computer physically faster, the idea is to make it **organizationally deeper**.

On the next page I have noted the end result of all the phases of the Shao Yong I Ching, this is the blueprint for the logic behind the system.

Kun (坤)	:Earth 土	Row of Water 水	The Sun (日)	:Fire 火	Octet 1	Great Heat (Pure Yang)	:Fire 火	The 8 Heavenly Tetragrams	QIAN (乾) :Metal 金	Greater Yang :Wood 木	Yang	
Bo (剝)	:Earth 土		The Moon (月)	:Fire 火		Lesser Heat	:Fire 火					
Bi (比)	:Water 水		The Stars (星)	:Water 水		Light of the Stars	:Fire 火					
Guan (觀)	:Wood 木		The Planets/Zodiac (辰)	:Water 水	Sunlight	:Fire 火						
Yu (豫)	:Wood 木		The Celestial Heat (暑)	:Wood 木	Octet 2	Moonlight	:Water 水		KUN (坤) :Earth 土	Greater Yin :Water 水		
Jin (晉)	:Fire 火		The Cosmic Cold (寒)	:Wood 木		Light of the Planets	:Water 水					
Cui (萃)	:Metal 金		The Daylight (晝)	:Earth 土		Lesser Cold	:Water 水		GEN (艮) :Earth 土			
Pi (否)	:Metal 金		The Night (夜)	:Earth 土	Great Cold (Pure Yin)	:Water 水						
Qian (謙)	:Earth 土		Row of Wood 木	The Great Wind (風)	:Wood 木	Octet 3	Great Force of Wind		:Wood 木	ZHEN (震) :Wood 木		Lesser Yin :Metal 金
Gen (艮)	:Earth 土			The Thunder (雷)	:Wood 木		Lesser Force of Wind		:Wood 木			
Jian (蹇)	:Water 水	The Rain (雨)		:Water 水	Flowing River Water		:Wood 木	XUN (巽) :Wood 木				
Jian (漸)	:Wood 木	The Dew (露)		:Water 水	Rainwater	:Wood 木						
Xiao Guo (小過)	:Wood 木	The Frost (霜)		:Earth 土	Octet 4	Dew water	:Metal 金	KAN (坎) :Wood 木	Lesser Yang :Fire 火			
Lu (旅)	:Fire 火	The Snow (雪)		:Earth 土		Groundwater	:Metal 金					
Xian (咸)	:Metal 金	The Fog/Mist (霧)		:Fire 火		Lesser Immovability of the Mountain	:Earth 土					
Dun (遯)	:Metal 金	The Clear Sky (晴)		:Fire 火	Octet 5	Great Immovability of the Mountain	:Earth 土					
Shi (師)	:Water 水	The Great Rivers (水)		:Water 水		The 8 Earthly Tetragrams	LI (離) :Fire 火					
Meng (蒙)	:Water 水	The Fire/Lava (火)		:Fire 火								
Kan (坎)	:Water 水	Row of Fire 火	The Soil/Plains (土)	:Earth 土	Octet 3	Great Force of Wind	:Wood 木	ZHEN (震) :Wood 木	Lesser Yin :Metal 金			
Huan (渙)	:Wood 木		The Rocky Mass (石)	:Wood 木		Lesser Force of Wind	:Wood 木					
Jie (解)	:Wood 木		The Great Oceans (海)	:Water 水		Flowing River Water	:Wood 木	XUN (巽) :Wood 木				
Wei Ji (未濟)	:Fire 火		The Active Volcanoes (火山)	:Fire 火	Rainwater	:Wood 木						
Kun (困)	:Metal 金		The Deep Canyons (谷)	:Wood 木	Octet 4	Dew water	:Metal 金	KAN (坎) :Wood 木	Lesser Yang :Fire 火

Lin (臨)	:Earth 土		The Animals (獸)	:Water 水		Lesser Immovability of the Mountain	:Earth 土					
Sun (損)	:Earth 土		Row of Metal 金	The Trees/Forests (木)	:Wood 木	Octet 5	Great Immovability of the Mountain	:Earth 土				
Jie (節)	:Water 水			The Minerals/Ores (金)	:Earth 土							
Zhong Fu (中孚)	:Wood 木			The Heavy Stones (石塊)	:Earth 土							
Gui Mei (歸妹)	:Wood 木	The Birds/Fowl (禽)		:Water 水								
Kui (睽)	:Fire 火	The Invertebrates (蟲)		:Fire 火								
Dui (兌)	:Metal 金	The Human Form (人)		:Fire 火								
Lu (履)	:Metal 金											
Guai (夬)	:Metal 金											
Qian (乾)	:Metal 金											

So, in here on the left we have 64 squares; 8 x earth, 9 x water, 11 x fire, 17 x metal and 19 x wood. That means that 64 combinations land on that many times each element.

This means that imagine that up means 1 and down means 0. Then from right to left from big to small we get a combination. So, Lesser → Lesser Yang → Li → Great Immovability of the Mountain → The Invertebrates (蟲) → Guai (夬) would be 000011. So, 000011 is recognized as metal. Same with, Greater Yin → Kun → Light of the Planets → The Rain (雨) → Wei Ji (未濟) is 101010. So, 101010 is fire.

From the division of the elements, we have the prime numbers 11, 17, and 19. This hopefully could prevent interference since they don't have any common denominators.

The 8 is a purely binary number, just as 9 is a perfect square; these should make it mathematically stable. These two conclusions are purely based on the dividing capabilities of these numbers.

It might be of note that the row is 6 layers deep as well. This means that in exactly 6 steps, we can decode one of these elements. Therefore, this architecture should **be** natively compatible with a 6-bit system. That would be logical, since the original binary system was built on the very same basis by Leibniz.

Here is the biggest problem though, normally we have 2 phases, on and off. But now we need 5 different ports to make the states possible. In computer terms I would say Multi-Valued Logic (MVL).

This made me think of the Setun-computer from 1958 made by the Soviet Union.

What they did was instead of a 0/1 they did +1/0/-1 which correlated to energy backwards (-1) no electricity 0 and energy forwards +1.

I was hoping that the earlier chapters could provide an extra two ports. Perhaps looking at the resistance or even the atomic radius could somehow bring a new way to map and engineer ports.

This is also the reason I chose the duodecimal base-12 system and the zodiac signs. The zodiac functions as a 12-fold matrix of positive and negative states: six daytime thrones and six nighttime thrones, configured across the four foundational elements (making 8 states), with the sun and moon acting as the positive and negative states of the aether (adding the remaining 4 states).

This is also the reason for the esoteric explanations in earlier chapters. Now you just have to look at the table of Hellenic – Wu Xing to look how to translate it. A day throne Aries can be translated to a Wu Xing state of wood. So, it was meant for future mapping both esoteric as for computing.

I have 2 things that come to mind as potential ideas.

Conceptual Avenue 1: Sifting Energy Through Pure Shape ($\pi/6$) Geometry.

- **The Core Idea:** What if the *shape* of the wire does the thinking instead of a software program?
- **The principle:** This angle hints at weaving the pathways of a chip into the exact interlocking triangles of the Kagome lattice. By using nature's own cutting rules, the $\pi/6$ matrix and the atomic radius of specific elements. The circuit becomes a physical filter. You feed basic electricity into the structure, and the geometric angles of the lattice automatically split, bounce, and sort the signal based on its phase and vibration. The wave naturally flows into the correct functional bucket simply because of the shape of the room it is traveling through.

Conceptual Avenue 2: Programming the Temperament of Matter (The Thermal Map).

- **The Core Idea:** What if the computer switches states by changing how the material *feels*?
- **The principle:** This angle looks at the chip not as a static piece of silicon, but as a living landscape of different elements that react uniquely to pressure or cold. By mapping how metals naturally shift between being Hardware Anchors or Thermal Travelers when cooled, the environment itself becomes the software. Shifting the temperature or the voltage changes the "path of least resistance" across the Base-12 grid. The material itself behaves like a dynamic map, routing the data to a new functional sector because its physical temperament has changed.

This is the concept I envision, though I currently lack the advanced technical knowledge to fully back it up or elaborate any further. However, according to the matrix, the sub-division of traditional binary states into five structural qualities should operate as follows:

- 0金 - 1金 (Metal / Contraction)
- 0土 - 1土 (Earth / Stability)
- 0木 - 1木 (Wood / Expansion)
- 0水 - 1水 (Water / Flow)
- 0火 - 1火 (Fire / Transformation)

The soviet Setun System.

In 1958, while the global computer industry was standardizing on the black-and-white domain of binary logic (0 and 1), a small team of engineers at Moscow State University, led by Nikolay Brusentsov, achieved a mathematical and hardware masterpiece: the Setun computer. Operating on an entirely different computational branch known as **balanced ternary**, Setun replaced the binary bit with the three-state "**trit**", processing values of -1 (negative voltage/backward), 0 (no current), and +1 (positive voltage/forward). From a purely information-theoretic perspective, radix-3 is the most efficient base for digital computing, offering higher density and a natural alignment with the mechanics of wave propagation and physical balance.

Hardware-wise, Setun bypassed the scarcity and unreliability of early vacuum tubes and silicon diodes by utilizing an incredibly robust architecture built on miniature magnetic core transformers (ferrite cores). Instead of slicing amplitudes into dangerous analogue voltage steps (which invites signal degradation) Setun achieved its stable three-state logic by exploiting the spatial orientation and magnetic polarity of its coils. Negative numbers, subtraction, and algebraic alignment did not require complex software routines or separate sign-bit registers; they were hard-wired into the native physics of the magnetic cores. By shifting from a rigid "on/off" framework to a spatial "**forward/zero/backward**" routing, Setun achieved flawless operational uptimes, establishing a historic precedent for modern Multi-Valued Logic (MVL) and proving that computing power is fundamentally defined by geometric and physical efficiency, rather than binary overhead.

This serves as a little introduction to the concept. There are multiple books and documents available that go more in depth about this subject. here I ignore the bureaucratic and political story of this product to focus more on the inner workings.

The other side of this story not highlighted here is only important when trying to sell this and not so much relevant other than that.

The Wu Xing Setun System (WXSS).

So this concept might be the most practical. Before explaining this lets have a look at the original Setun system and how it is relevant to this document.

Just use the original Setun setup and make from 3 phases 5.

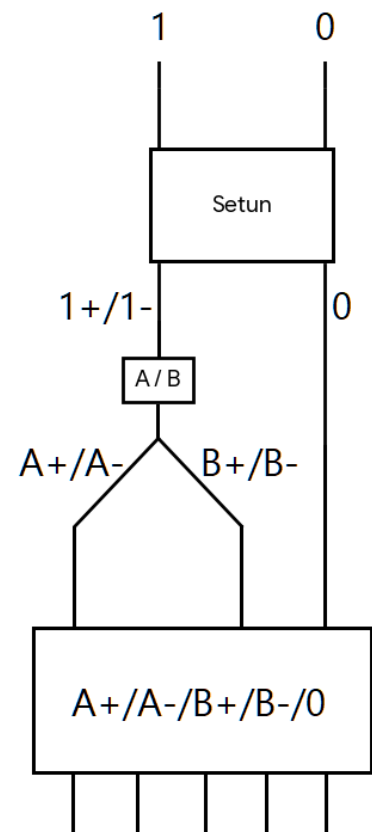

- 0=土 Earth
- A-=金 Metal
- A+=木 Wood
- B-=水 Water
- B+=火 Fire

As far as my knowledge goes 0 is still 0. There is no 0- or 0+ or 0A or 0B, so splitting it should result in 5 phases, not 6.

Next to this I made a short schematic to illustrate the core idea.

The positive side about this setup is that with 5 physical wires you don't have to under divide the voltages as how we have M.L.V. today. But on the other hand the challenge lies in the [A/B] box.

The thing I think about would be a bootstrap protocol to circumvent that problem but how exactly is something is do not know.

One really positive part is that from 2 to 5 phases would mean it is theoretically possible to have backwards compatibility with our current computer technology and this setup. The reason I highlight this is because that means we don't have to redo all the progress made in binary computer technology. This makes the 5 phase computer more interesting and more viable from the point of view of marketing and finances. The interesting thing is that with 3 slots open you could choose to split the tasks up between binary and ternary or even use all slots to calculate any given task faster. There are at least quite some interesting possibility's with this kind of setup.

One of the most interesting things is that according to the mapping, you could start with a 16-state matrix and scale up to 32 and 64 states. Because 1111 equals Fire in a 16-state setup (4-bit), 11111 equals Fire in a 32-state setup (5-bit), and 111111 lands on Earth in the full 64-state matrix (6-bit). This means that theoretically, one could make a simple test within a 16-state environment. I look at it as a motor with multiple transmissions that you could later switch to if needed.

The interesting thing here is that Wood and Fire seems the two main veins while the others sometimes disappear.

One of the most profound behavioural patterns of this matrix is how it breathes across the different bit depths. The 16 and

64 layers funnels act as 'full phase' anchors where all five physical elements are simultaneously active and balanced. In contrast, the 4, 8, and 32 configurations act as dynamic alternates, systematically dropping a specific element (Metal at 32, Water at 8, and Earth at 4).

depth	木 Wood	金 Metal	火 Fire	土 Earth	水 Water
64	19	17	11	8	9
32	8	0	8	8	8
16	4	2	4	2	4
8	3	2	1	2	0
4	1	1	1	0	1

This geometric alternation creates a natural computational pulse, allowing the hardware to natively shift its impedance and thermal load simply by switching gears.

Software-wise, this matrix functions as a **hardware-assisted bitmask**. Instead of wasting CPU cycles and energy on complex software overhead to route data, the chosen bit depth natively determines the routing. Wood and Fire act as the constant **Data Lanes**, ensuring the program counter and processing core never lose power. Meanwhile, the rotating zeros of Metal, Water, and Earth act as passive **Instruction Filters**. By simply shifting gears, the hardware automatically disables specific paths, forcing the data stream to self-route through the remaining geometry with zero computational lag.

Or more simply said, The rotating zeros (0) are not missing data; they are **built-in traffic lights**.

- **Wood and Fire** are the main highways that always stay open to keep the engine running.
- **Metal, Earth, and Water** take turns shutting down depending on the gear you choose.

When a wire hits 0, that road is blocked, forcing the electricity to naturally change its route without needing any software code or decisions to tell it where to go. The shape of the gear does all the thinking automatically.

If we do have a difference in elements and some pathways are more often used than others than there could be asymmetrical heating. To resolve this perhaps it could be a good idea to look at different materials for different pathways. As an example I could say copper, silver, lead or something like that. The specific chosen elements are depending on the load of heat and the speed of data.

The original statement from earlier drafts still stands though, my computer knowledge goes so far and this is that limit. If this works or could be applicable is something greater minds need to look at.

My hope is that there is a Wozniak out there capable of linking the parts I miss to construct a whole new computer. We are due to an upgrade from our black and white point of view to an multilayered one. No one knows everything but everybody knows something. Even though I learn along the way and will correct any earlier misconceptions as I go onwards. This also means that critical thinking is required from the readers part.

I did notice even in the esoteric field I broke with a 2200 year old tradition. I will make a separate chapter later on elaborating exactly the mapping of the elements and why and how it differs from the king Wu tradition, simply saying form and function might not be clear enough. The elements are chosen through a methodical framework and I only shown the results. The shortest thing that I can say about it is that the moon reflects the power of the sun and does not drown it so putting it in water instead of fire is a clear sign of exoteric views.

Madhatter out.
